# Project 3 Voice recognition set of words to actions.

This project not only can recognize what you say but also can translate the words you say and pronounce them. Meanwhile, it can record the things you enter and send them to tomcat server.

I have almost finished the App. Now, it can:
1. Recognize the speech
2. Transform the speech to text.
3. Translate
4. Pronounce the result of translation

The last step is to set up a web server that can store the words translated.
